Phytochemical constituents of some Algerian medicinal plants

Nacéra Belmekki, Nassima Bendimerad and Meriem Seladjí.

Université de Tlemcen, Laboratoire des Produits Naturels, Département de Biologie. Nouveau Pôle Rocade II, Tlemcen 13000, Algérie.

ABSTRACT

Some chemical compounds distribution in three plants belonging to Lamiaceae family were assessed and compared. The medicinal plants investigated were Saccocalyxsatureioïdes, Teucriumpolium, Salvia verbenaca which were found to contain flavonoids, tannins, and volatile oils. Saponins and alkaloids were found presente in Saccocalyxsatureioïdes, Teucriumpolium but absent in Salvia verbenaca.

Key words: Medicinal plants, phytochemical constituents, Saccocalyxsatureioïdes, Teucriumpolium, Salvia verbenaca.

INTRODUCTION

Chemical compounds that occur naturally in plants, are responsible for color and organoleptic properties. The term is generally used to refer to those chemicals that may have biological significance but are not established as essential nutrients. Scientists estimate that there may be as many different phytochemicals having the potential to affect diseases such as cancer, stroke or metabolic syndrome[1].

For centuries, plant and plant products have been used for treating various illnesses. Today, several medicinal plants and their products are still in use, being employed as home remedies, over the counter drugs as well as raw materials for the pharmaceutical industry and they represent a substantial proportion of the global drug market [2].

Plants belonging to the Labiatae family are rich in polyphenolic compounds and a large number of them are well known for their antioxidant properties[3,4].

The plant family Lamiaceae Martinov (= Labiatae Adans., the mint family) has a world-wide distribution and comprises more than 7200 species across approximately 240 genera which are classified in seven subfamilies[5]. Among them:

Saccocalyxsatureioïdes Coss.et Dur., called Zaater or Azir El-ibel[6] by locals It grows naturally on the dunes of the pre-desertic area [7] in the Aïnsefra region of Naâma south western Algeria, with a blossoming period in March. This medicinal plant is used as an ingredient in numerous local traditional medicines and mostly in the care of diabetes[8].

Teucriumpolium L., or Jaadah as it is known in west Algeria is a dwarf, pubescent, aromatic shrub possessing oval leaves with enrolled margins and dense heads of white flowers [9]. It is mainly Mediterranean and west Irano- Turanian and can be found in countries such as Iraq, Saudi Arabia and Egypt [10].
It is well known for its antinociceptive[11], antioxidant[12], hypolipidemic[13], anti-inflammatory, anti-
rheumatoid[14], and hypoglycemic [15]properties.

Salvia is an important and diversified genus of the Lamiaceae family, with more than 900 species. Commonly found in the Mediterranean regions, salvia is widely cultivated[16]and used in flavouring and folk medicine for the treatment of coronary heart diseases[17], cerebrovascular diseases[18], hepatitis, hepatic cirrhosis[19] and chronic renal failure[20]. In Algerian traditional medicine, decoctions of its aerial parts were reportedly used as a cholagogue, antiseptic, diuretic and astringent[21]. *S. verbenaca* locally named Essaffaya is particularly using in the healing of wounds[22].

The present study was designed to investigate the pharmacognostic and phytochemical properties of *Saccocalyxsatureioïdes*, *Teucrium polium* and *Salvia verbenaca*.

**MATERIALS AND METHODS**

**Plant materials**

The aerial parts of *Saccocalyxsatureioïdes*, *Teucrium polium*, *Salvia verbenaca* and were collected in April, 2007 were analyzed. Thereby-cut plants were dried in a dry and shady place at ambient temperature.

Plants were identified at the laboratory of Ecology and Management of Natural Ecosystems of the University of Tlemcen (Algeria).

Phytochemical tests are performed on different extracts prepared from the dried leaves and ground, using three solvents of different polarities: water, ethanol and diethyl ether. The detection method of the different families of chemical compounds co-existing is precipitation reaction or staining reagents. These reactions result in the appearance of turbidity, flocculation or a color change which may, depending on the intensity of the result, the concentration of certain constituents [23,24].

**Preparation of ethanolic extract:** The ethanolic extract was prepared by a mixture of 50 g dried powdered samples in 300 mL of ethanol under reflux for 1 h. The extract is filtered by using Whatman filter paper. The filtrate was used for phytochemical screening.

**Test of flavonoids:** Treat 5 mL of alcoholic extract with a few drops of concentrated HCl and 0.5 g of magnesium turnings[25].

**Test of tannins:** In a test tube, 1 mL of ethanolic solution was added to 2 mL of water and 2-3 drops of diluted solution of FeCl₃and observed for a green, a blue black or a blue - green coloration, which shows the presence of tannins[26].

**Test for alkaloids:** 20 mL of the extract was added to 5 mL of HCl (10%). At this acidic medium heated in a water bath, was added a volume of NH₄OH (10%) until obtain a medium of pH= 9 which was extracted with diethyl ether and concentrate with a rotary evaporator. The residue will be taken in 0.5 mL of HCl (2%), divide into two equal parts. The first was treated with a few drops of Mayer's reagent and the second with Wagner's reagent. Observation: turbidity or precipitation[27].

**Test for steriods:** After evaporation of 10 mL of the ethanolic solution, the residue was taken in 10 mL of CHCl₃ filtrates and added to 5 mL of acetic anhydride and some drops of H₂SO₄. The mixture was agitated. The colour changed from violet to green indicating the presence of steroids[28].

**Test for sterolicheterosides and triterpenicheterosides:** A mixture of 0.5 mL of acetic anhydride and 0.5 mL of CHCl₃ was added to the residue obtained after evaporation of ethanolic solution (10 mL). The filtrate was treated with Liebermann's reagent Burchardt. If a solution is blue - green appears, it indicates the presence of sterolicheterosides if it is violet- green, it indicates the presence of triterpenicheterosides[29].

**Test for reducing compounds:** 2 mL of aqueous solution was added at 1 mL of the alcoholic solution and 20 drops of Fehling's solution, heat the solution. A brick red precipitate marks the presence of carbohydrates [26].

**Test of coumarins:** 15 mL of HCl (10%) was added to 25 mL of ethanolic solution, and heated under reflux for 30 min and strain the mixture. The residue was extracted with 15 mL of etherin triplicate. Divide the filtrate into three equal
parts, evaporate the first in a rotary evaporator, dissolve the residue in 1 mL of water and divide the volume into two parts, treat the first with 0.5 mL NH₄OH (10%), examined under ultra-violet light, fluorescence intensity indicates the presence of coumarins.

The second one was used as control [30].

**Test of anthracenosides:** 8 mL of the ethereal solution was treated by extractive reagent Bornträger. A positive test is revealed by the appearance of a color ranging from bright orange - red to purple – purple [30].

**Test of anthocyanosides:** The acidic aqueous solution was treated with NaOH. The presence of anthocyanins was confirmed by a red color at pH under 3 and blue color at a pH between 4 and 6 [30].

**Preparation of diethyl ether extract:** The extract was prepared by a mixture of 50 g dried powdered samples in 300 mL of diethyl ether under reflux for 1 h. The extract is filtered by using Whatman filter paper. The filtrate was used for phytochemical screening.

**Test of volatile oils:** The residue obtained after evaporation of 20 mL of ethereal solution was dissolved in ethanol and concentrated. A residual aroma reveals a positive test [31].

**Test of alkaloids bases:** The resulting residue obtained was dissolved after evaporation of 10 mL of the ethereal solution in 1.5 mL of HCl 2% and add 1-2 drops of Mayer or Wagner reagent. The appearance of yellowish white precipitate indicates the presence of alkaloid bases [27].

**Test of fatty acids:** The alkaline aqueous solution was acidified, and then extracted with diethyl ether. The ethereal solution is then concentrated to dryness. A positive test is revealed by obtaining a greasy residue [31].

**Test of emodols:** 3 mL of the ethereal solution was evaporated and added 1 mL of NH₄OH to the resulting residue. A red orange color appears below a violet one after addition of Bornträger react if indicates the presence of emodols [30].

**Preparation of aqueous extract:** The extract was prepared by a mixture of 50 g dried powdered samples in 300 mL of diethyl ether under reflux for 1 h. The extract is filtered by using Whatman filter paper. The filtrate was used for phytochemical screening.

**Test of tannins:** 1 mL of the aqueous solution was treated with 1 mL of water and 1-2 drops of dilute solution of FeCl₃. The appearance of a dark green color or blue-green indicates the presence of tannins [26].

**Test of saponins:** 2 mL of the aqueous solution was added to a little of water and then stir in a strong way [30]. Persistent foam confirmed the presence of saponins.

Abandon the mixture for 20 minutes and classify content saponins:
- No foam = Negative test.
- Foam less than 1 cm = weakly positive test.
- Moss 1-2 cm = positive test.
- Foam over 2 cm = very positive test.

**Test of starch:** 5 mL of solution prepared was treated with the reagent for starch. The appearance of a purplish blue color indicates the presence of starch [32].

**RESULTS AND DISCUSSION**

Qualitative analysis carried out for ethanolic, diethyl ether and aqueous extracts of the aerial parts of *Saccocalyx xasureoides*, *Teucrium polium*, *Salvia verbenaca* showed the presence of some medicinal active constituents (tables 1, 2, 3).

Phytochemical screening of our plant’s aerial parts revealed the absolutely absence of anthocyanosides, anthracenosides, reducing compounds, steriods, triterpenicheterosides and coumarins (table 1), while Peter Y et al., (1983) [33] mentioned that the aerial part of *Teucrium polium* L. var. polium contain two new clerodanediterpenoids, teupolin IV and teupolin V.
Alkaloids are present in *Saccocalyxsatureioïdes* and *Teucriumpolium*, but absent in *Salviaverbenaca* (tables 1, 2).

The presence of tannins in the aerial parts of our plants was confirmed by a positive reaction with ferric chloride solution giving a dark green color, so this tannins catechists (tables 1, 3).

Essential oils were present in significant quantity in *Saccocalyxsatureioïdes*, as reported Biondi et al. (2006) and Laouer et al. (2006) [34, 35], in less quantity in *Teucriumpolium* as found (Aburjai et al. 2006) and (Kabouche et al., 2007) [36, 37], and in more less quantity in *Salviaverbenaca* (table 2).

### CONCLUSION

The plants studied here can be seen as a potential source of useful drugs. Further studies are going on these plants in order to isolate, identify, characterize and elucidate the structure of the bioactive compounds. The antimicrobial activities of these plants for the treatments of the diseases as claimed by traditional healers are also being investigated.
