ABSTRACT

We have been hearing for quite a long time that 'fever isn't an illness yet an indication'. Doctors state that fever is a manifestation of illnesses like influenza to malignant growth. The moderate fever definition, finding, and medicines depend on fever as a side effect. All the examinations identified with fever as an indication of a malady have been managed without knowing the Motivation behind the temperature of fever is. Without knowing the Reason for the temperature of fever, by what means can fever remembered for the indication definition? Temperature between 38o to 41o centigrade can be side effect of an infection? The majority of the infections might not have a fever. Here and there it vanishes. At that point, is fever a manifestation of which malady? Side effect Definition is the main boundary fundamental for a Manifestation. Likewise with any or every single other definition, indication definition ought to depict the side effect deductively. On the off chance that it can't portray plainly, there is no utilization of a side effect definition. A side effect is a takeoff from ordinary capacity or feeling which is seen uniquely by a patient, demonstrating the nearness of infection or variation from the norm. One can't be seen straightforwardly the temperature is raised in the nerve center. A mechanical gadget is important to quantify raised temperature in the nerve center. In manifestation definition, fever definition can't be found. The rise of internal heat level is excluded from manifestation definition.

Keywords: Indication Definition, Signs Definition, Manifestations of fever, side effects of rising temperature.

INTRODUCTION

The conservative fever definition, diagnosis, and treatments are based on fever as a symptom. All the studies related to fever as a symptom of a disease have been done without knowing the Purpose of the temperature of fever is. In the current COVID-19 epidemic situation, it has great importance. Because Fever is considered as an important part of Corona disease. Not knowing the purpose of temperature of fever, how can fever included as a symptom in COVID-19?

Distinctive reason for sicknesses never shows similar manifestations:

Various reasons for infections like infection, microbes, growths, venom, repulsiveness scene, ghastliness dream, never shows similar manifestations. Its activities are extraordinary and here and there inverse. No similitudes can be seen between their activities. Raised temperature or expanded temperature never makes fever or side effects of fever. It might make hyperthermia. None of the maladies or reasons for infections requires fever as its side effect. In the event that the mosquito chomps its infection, microbes, venom gets saved in the body subsequently as indicated essentially and quality of Infections, microorganisms, venom manifestations like tingling, torment, and signals like shading change, irritation may happen [1]. We can see the manifestations, Signs, and signs of the infection, microbes,

the venom which different or spreading or damages(disease) the body before fever develop. Patients who have influenza to malignant growth might not have a fever.

How might we separate manifestations of the ailment and side effects of fever and indications of rising temperatures?

In fever, the two side effects of illness and indications of Fever are incorporated. Deduct indication of infection from complete manifestations; we will get side effects of fever. (Illness +Fever)- Malady =Fever. (Manifestations of ailment +Symptoms of Fever)- Indications of ailment =Symptoms of Fever (harsh taste, body torment, weakness to mind and body, diminished hunger, decreased movement and acid reflux, inward and outside distress). Like that we can isolate signs, signals, and activities of both fever and malady.

(Signs of malady +Signals of Fever) -Signs of illness =Signals of Fever (high temperature, shuddering, unconscious). (Indications of sickness +Signs of Fever) - Indications of illness =Signs of Fever [2]. (Activities of sickness +Actions of Fever) - Activities of illness =Actions of Fever. In fever doesn't show any activities of temperature rise.

How might we demonstrate the fever isn't a manifestation:

The fever isn't manifestation when inspected in different ways. In fever, the two side effects of malady and manifestations of fever are incorporated. Deduct side effect of infection from complete indications, we will get manifestations of fever. we can isolate signs, signals, and activities of both fever and infection and rising temperature [3]. Temperature between 38 degrees and 41 degrees can't be a side effect of any of the infections. An alternate reason for infections like infection, microorganisms, parasites, venom, awfulness scene, and repulsiveness dream never shows similar manifestations. Fever has never been experimentally demonstrated as a side effect of an ailment. Fever has the properties of adjustment[4]. On the off chance that we pose any sort of inquiry identified with fever by expecting that the fever isn't a side effect we will find a reasonable solution. On the off chance that we maintain a strategic distance from or dodge from this we will never find a legitimate solution to even a solitary inquiry.

CONCLUSION

Fever is not a symptom in COVID-19, when examined in various directions. None of the diseases require fever as its symptom. Temperature between 38 degrees and 41 degrees cannot be a symptom of any of the diseases. A different cause of diseases like virus, bacteria, fungi, venom, horror scene, and horror dream never shows the same symptoms. Opposite diseases never show the same symptoms. When the disease becomes a threat to life or organs, the temperature of fever is a warning signal of a disease. Fever has never been scientifically proved as a symptom of a disease. Fever has the properties of adaptation. Fever treatment should be revised according to the warning signal of a disease. A new fever definition, diagnosis and treatment is required. It is wonderful that a physician having years of experience in fever treatment cannot understand actual fever definition and fever treatment have no relation with symptom definition and diagnosis. In the early days of my discovery, I thought that fever is a symptom of disease. I never got any answers for even a single question about symptoms. That induced me to find out the real truth of fever. I can eliminate fever definition, diagnosis and treatment. If you discard this discovery it would be an injustice to mankind.
